Motivation

Classical Approach

Minimize total number of bends or maximum number of bends per edge.

Is minimization of bends always the best choice?

9 bends in total; at most 4 bends per edge

7 bends in total; at most 2 bends per edge

What should be done if different edges have different importance?

The FLEXDRAW Problem

FLEXDRAW Problem

Given

- a 4-planar graph G = (V, E)
- and a function flex : $E \longrightarrow \mathbb{N}_0$ assigning a *flexibility* to every edge.

Find

- a planar orthogonal drawing of G
- such that every edge $e \in E$ has at most flex(e) bends.

Reducing the Rotation

nan

10/25

Lemma

Given a graph with positive flexibility and a drawing with $rot(\pi(s, t)) \ge 0$. We can reduce the rotation by 1.

 \Rightarrow The possible values form an interval. \Rightarrow There are no "rigid" graphs.

Shape of a Graph

For the set Ω of all valid drawings with respect to the embedding \mathcal{E} define

$$\mathsf{maxrot}_\mathcal{E}(G) = \max_{\mathcal{R} \in \Omega} \mathsf{rot}_\mathcal{R}(\pi(s, t))$$

Theorem

For $\rho \in [-1, \max \operatorname{rot}_{\mathcal{E}}(G)]$ a valid drawing with $\operatorname{rot}(\pi(s, t)) = \rho$ exists.

Summary – Fixed Planar Embedding

No "rigid" drawings: the rotation can always be reduced.

Theorem

For $\rho \in [-1, \max \operatorname{rot}_{\mathcal{E}}(G)]$ a valid drawing with $\operatorname{rot}(\pi(s, t)) = \rho$ exists.

Now we drop the fixed planar embedding.

Replacing Subgraphs by Gadgets

Computing the Maximum Rotation

Ingredients for Computing the Maximum Rotation

- Represent all planar embeddings with s and t on the outer face with the SPQR-tree.
 [Di Battista, Tamassia 1996]
- Traverse the SPQR-tree bottom up and compute the maximum rotation for each node.
- Replace visited nodes by gadgets to reduce the number of embeddings.

Conclusion

Results

- Solve FLEXDRAW for graphs with positive flexibility.
- Complexity gap between NP-hardness for 0-embeddability and polynomial-time algorithms for 2-embeddability closed.
- Maximum rotation yields characterization of possible shapes.

Open Problems

- Speed up from $O(n^{5/2})$ to $O(n^2)$.
- Can FLEXDRAW be solved efficiently if a subgraph has flexibility 0?
 e.g. matchings, trees, series parallel graphs, graphs with max deg 3
- Some kind of optimization.
